EXPLANATION OF THE TABLES*

TABLE I. FIVE-PLACE COMMON LOGARITHMS OF NUMBERS FROM 1 TO 10 000

1. Powers of 10. Consider the following table of values of powers of 10:

Column A		Column B	Column A		Column B
10^1	=	10	10^0	=	1.
10^2	=	100	10^{-1}	=	.1
10^3	=	1000	10^{-2}	=	.01
10^4	=	10000	10^{-3}	=	.001
10^5	=	100000	10^{-4}	=	.0001
10^6	=	1000000	10^{-5}	=	.00001
10^7	=	10000000	10^{-6}	=	.000001
10^8	=	100000000	10^{-7}	=	.0000001
10^9	=	1000000000	10^{-8}	=	.00000001
10^{10}	=	10000000000	10^{-9}	=	.000000001

This table may be used for multiplying or dividing powers of 10, by means of the rules $10^a \cdot 10^b = 10^{a+b}$, $10^a \div 10^b = 10^{a-b}$. Thus, to multiply 1000 by 100,000, add the exponent of 10 in column A opposite 1000 to the exponent of 10 opposite 100,000: $3 + 5 = 8$; and look for the number in column B opposite 10^8, *i.e.* 100,000,000. Similarly $1{,}000{,}000 \times .0001 = 100$, since $6 + (-4) = 2$.

To divide 1,000,000 by 100, from the exponent of 10 opposite 1,000,000 subtract the exponent of 10 opposite 100; $6 - 2 = 4$; and look for the number opposite 10^4, *i.e.* 10,000. Similarly $.001 \div 1{,}000{,}000 = .000000001$, since $-3 - 6 = -9$. To find the 4th power of 100, multiply the exponent of 10 opposite 100 by 4: $4 \times 2 = 8$, and look for the number opposite 10^8, *i.e.* 100,000,000. Likewise $(.001)^3 = .000000001$, since $3 \times (-3) = -9$. To find the cube root of 1,000,000,000, divide the exponent of 10 opposite 1,000,000,000 by 3, $9 \div 3 = 3$, and look for the number opposite 10^3.

* This Explanation, written to accompany the five-place tables, may be used also for the four-place tables by omitting the last figure in each example in a manner obvious to the teacher.

2. Common Logarithms. The exponent of 10 in any row of column A is called the common logarithm * of the number opposite in column B; thus $\log 10 = 1$, $\log 100 = 2$, $\log 1000 = 3$, etc.; $\log 1 = 0$, $\log .1 = -1$; $\log .01 = -2$, $\log .001 = -3$, etc. In general, if $10^l = n$, l is called the *common logarithm of* n, and is denoted by *log* n.

3. Fundamental Principles. Logarithms are useful in reducing the labor of performing a series of operations of multiplication, division, raising to powers, extracting roots, as above; they have no necessary connection with trigonometry, since all the operations could be performed without them; but they are a great labor-saving device in arithmetical computations. They do not apply to addition and subtraction.

The principles of their application are stated as follows:

I. *The logarithm of a product is equal to the sum of the logarithms of the factors:* $\log ab = \log a + \log b$. This follows from the fact that if $10^l = a$ and $10^L = b$, $10^{l+L} = a \cdot b$. In brief: *to multiply, add logarithms.*

II. *The logarithm of a fraction is equal to the difference obtained by subtracting the logarithm of the denominator from the logarithm of the numerator:* $\log (a/b) = \log a - \log b$. For, if $10^l = a$ and $10^L = b$, then $10^{l-L} = a \div b$. In brief: *to divide, subtract logarithms.*

III. *The logarithm of a power is equal to the logarithm of the base multiplied by the exponent of the power:* $\log a^b = b \log a$. This follows from the fact that if $10^l = a$, then $10^{lb} = a^b$.

IV. *The logarithm of a root of a number is found by dividing the logarithm of the number by the index of the root:* $\log \sqrt[b]{a} = (\log a)/b$. This follows from the fact that if $10^l = a$, then $10^{l/b} = a^{1/b} = \sqrt[b]{a}$.

Corollary of II. *The logarithm of the reciprocal of a number is the negative of the logarithm of the number:* $\log (1/a) = -\log a$, since $\log 1 = 0$.

4. Characteristic and Mantissa. It is shown in algebra that every real positive number has a real common logarithm, and that if a and b are any two real positive numbers such that $a < b$, then $\log a < \log b$. Neither zero nor any negative number has a real logarithm.

An inspection of the following table, which is a restatement of a part

a	1	10	100	1000	10000	100000	1000000	10000000
$\log a$	0	1	2	3	4	5	6	7

* Common logarithms are exponents of the base 10; other systems of logarithms have bases different from 10; Napierian logarithms (see Table VII, p. 112) have a base denoted by e, an irrational number whose value is approximately 2.71828. When it is necessary to call attention to the base, the expression $\log_{10} n$ will mean common logarithm of n; $\log_e n$ will mean the Napierian logarithm, etc.; but in this book $\log n$ denotes $\log_{10} n$ unless otherwise explicitly stated.

of the table of § 1, p. v, shows that

the logarithm of every number between 1 and 10 is a proper fraction,

the logarithm of every number between 10 and 100 is 1 + a fraction,

the logarithm of every number between 100 and 1000 is 2 + a fraction;

and so on. It is evident that the logarithm of every number (not an exact power of 10) consists of a whole number + a fraction (usually written as a decimal). The whole number is called the **characteristic**; the decimal is called the **mantissa**. The characteristic of the logarithm of any number greater than 1 may be determined as follows:

RULE I. *The characteristic of any number greater than 1 is one less than the number of digits before the decimal point.*

The following table, which is taken from § 1, p. v, shows that

a	.0000001	.000001	.00001	.0001	.001	.01	.1	1
$\log a$	-7	-6	-5	-4	-3	-2	-1	0

the logarithm of every number between .1 and 1 is -1 + a fraction,

the logarithm of every number between .01 and .1 is -2 + a fraction,

the logarithm of every number between .001 and .01 is -3 + a fraction;

and so on.

Thus the characteristic of every number between 0 and 1 is a negative whole number; there is a great practical advantage, however, in computing, to write these characteristics as follows: $-1 = 9 - 10$, $-2 = 8 - 10$, $-3 = 7 - 10$, etc. *E.g.* the logarithm of .562 is $-1 + .74974$, but this should be written $9.74974 - 10$; and similarly for all numbers less than 1.

RULE II. *The characteristic of a number less than 1 is found by subtracting from 9 the number of ciphers between the decimal point and the first significant digit, and writing -10 after the result.*

Thus, the characteristic of $\log 845$ is 2 by Rule I; the characteristic of $\log 84.5$ is 1 by (I); of $\log 8.45$ is 0 by (I); of $\log .845$ is $9 - 10$ by (II); of $\log .0845$ is $8 - 10$ by (II).

An important consequence of what precedes is the following:

To move the decimal point in a given number one place to the right is equivalent to adding one unit to its logarithm, because this is equivalent to multiplying the given number by 10. Likewise, to move the decimal point one place to the left is equivalent to subtracting one unit from the logarithm. Hence, moving the decimal point any number of places to the right or left does not change the mantissa but only the characteristic.*

Thus, 5345, 5.345, 534.5, .05345, 534500 all have the same mantissa.

* Another rule for finding the characteristic, based on this property, is often useful; if the decimal point were just after the first significant figure, the characteristic would be zero; start at this point and count the digits passed over to the left or right to the actual decimal point; the number obtained is the characteristic, except for sign; the sign is negative if the movement was to the left, positive if the movement was to the right.

5. Use of the Table. To use logarithms in computation we need a table arranged so as to enable us to find, with as little effort and time as possible, the logarithms of given numbers and, vice versa, to find numbers when their logarithms are known. Since the characteristics may be found by means of Rules I and II, p. vii, only mantissas are given. This is done in Table I. Most of the numbers in this table are irrational, and must be represented in the decimal system by approximations. A five-place table is one which gives the values correct to five places of decimals.

PROBLEM 1. *To find the logarithm of a given number.* First, determine the characteristic, then look in the table for the mantissa.

To find the mantissa in the table when the given number (neglecting the decimal point) consists of four, or less, digits (exclusive of ciphers at the beginning or end), look in the column marked N for the first three digits and select the column headed by the fourth digit: the mantissa will be found at the intersection of this row and this column. Thus to find the logarithm of 72050, observe first (Rule I) that the characteristic is 4. To find the mantissa, fix attention on the digits 7205; find 720 in column N, and opposite it in column 5 is the desired mantissa, .85763; hence log 72050 = 4.85763. The mantissa of .007826 is found opposite 782 in column 6 and is .89354; hence log .007826 = 7.89354 − 10.

6. Interpolation. If there are more than four significant figures in the given number, its mantissa is not printed in the table; but it can be found approximately by assuming that the mantissa varies as the number varies in the small interval not tabulated; while this assumption is not strictly correct, it is sufficiently accurate for use with this table.

Thus, to find the logarithm of 72054 we observe that log 72050 = 4.85763 and that log 72060 = 4.85769. Hence a change of 10 in the number causes a change of .00006 in the mantissa; we assume therefore that a change of 4 in the number will cause, approximately, a change of .4 × .00006 = .00002 (dropping the sixth place) in the mantissa; and we write log 72054 = 4.85763 + .00002 = 4.85765.

The difference between two successive values printed in the table is called a **tabular difference** (.00006, above). The proportional part of this difference to be added to one of the tabular values is called the **correction** (.000002, above), and is found by multiplying the tabular difference by the appropriate fraction (.4, above). These proportional parts are usually written *without the zeros*, and are printed at the right-hand side of each page, to be used when mental multiplications seem uncertain.

Example 1. Find the logarithm of .0012647. Opposite 126 in column 4 find .10175; the tabular difference is 34 (zeros dropped); .7 × 34 is given in the margin as 24; this correction added gives .10199 as the mantissa of .0012647; hence log .0012647 = 7.10199 − 10.

Example 2. Find the logarithm of 1.85643. Opposite 185 in column 6 find .26858; tabular difference 23; .43 × 23 is given in the margin as 10; this correction added gives [illegible] mantissa of 1.85643; hence log 1.85643 = 0.26868.

7. Reverse Reading of the Table. PROBLEM 2. *To find the number when its logarithm is known.* First, fixing attention on the mantissa only, find from the table the number having this mantissa, then place the decimal point by means of the two following rules:*

RULE III. *If the characteristic of the logarithm is positive (in which case the mantissa is not followed by — 10), begin at the left, count digits one more than the characteristic, and place the decimal point to the right of the last digit counted.*

RULE IV. *If the characteristic is negative (in which case the mantissa will be preceded by a number n and followed by — 10†), prefix 9 — n ciphers, and place the decimal point to the left of these ciphers.*

Example 1. Given $\log x = 1.22737$, to find x.

Since the mantissa is 22737, we look for 22 in the first column and to the right and below for 737, which we find in column 8 opposite 168. The number is therefore 1688. Since the characteristic is +1, we begin at the left, count 2 places, and place the point; hence $x = 16.88$.

Example 2. Given $\log x = 2.24912$, to find x.

This mantissa is not found in the table; in such cases we interpolate as follows: select the mantissa in the table next less than the given mantissa, and write down the corresponding number; here, 1774; the tabular difference is 25; the actual difference (found by subtracting the mantissa of 1774 from the given mantissa) is 17; hence the proportionality factor is 17/25 = .68 or .7 (to the nearest tenth). Since moving the decimal point does not affect the mantissa, it follows that the digits in the required number are 17747 (to five places). The characteristic 2 directs to count 3 places from the left; hence $x = 177.47$.

RULE. *In general, when the given mantissa is not found in the table, write down four digits of the number corresponding to the mantissa in the table next less than the given mantissa, determine a fifth figure by dividing the actual difference by the tabular difference, and locate the decimal point by means of the characteristic.*

8. Illustrations of the Use of Logarithms in Computation.

Example 1. To find $832.43 \times 302.43 \times 16.725 \times .000178$.

$\log 832.43 = 2.92034$
$\log 302.43 = 2.48062$
$\log 16.725 = 1.22337$
$\log .000178 = \underline{6.25042 - 10}$ (add)
$\log x = 2.87475$ whence $x = 749.47$.

Example 2. To find $461.29 \div 21.4$.

$\log 461.29 = 2.66397$
$\log 21.4 = \underline{1.33041}$ (subtract)
$\log x = 1.33356$ whence $x = 21.556$.

---

* Another convenient form of these rules is as follows: if the characteristic were zero, the decimal point would fall just after the first significant figure; move the decimal point one place to the right for each positive unit in the characteristic, one place to the left for each negative unit in the characteristic.

† In rare cases — 20, — 30, etc.

Illustration of Cologarithms

Example 3. To find $\frac{48.25 \times 132.76 \times .1745}{1415.3}$.

We might add the logarithms of the factors in the numerator and from this sum subtract the logarithm of the denominator; but we can shorten the operation by *adding* the negative of the logarithm of the denominator instead of subtracting the logarithm itself. The negative of the logarithm of a number (when written in convenient form for computation) is called the **cologarithm** of the number. We may find the negative of any number by subtracting it from zero, and it is convenient in logarithmic computation to write zero in the form $10.00000 - 10$. Thus the negative of 2.17 is $7.83 - 10$; the negative of $1.1432 - 10$ is 8.8568. Remembering that the cologarithm of a number is its negative we have the following rule:

To find the cologarithm of a number begin at the left of its logarithm (including the characteristic) and subtract each digit from 9, except the last, which subtract from 10; if the logarithm has not -10 after the mantissa, write -10 after the result; if the logarithm has -10 after the mantissa, do not write -10 after the result.*

By this rule the cologarithm of a number can be read directly out of the table without taking the trouble to write down the logarithm. Attention must be given not to forget the characteristic. The use of the cologarithm is governed by the principle:

Adding the cologarithm is equivalent to subtracting the logarithm.

Returning to the computation of the given problem we should write:

$$\begin{aligned}
\log 48.25 &= 1.68350 \\
\log 132.76 &= 2.12307 \\
\log .1745 &= 9.24180 - 10 \\
\operatorname{colog} 1415.3 &= \underline{6.84915 - 10} \quad \text{(add)} \\
\log x &= 9.89752 - 10 \quad \text{whence } x = .7898
\end{aligned}$$

Example 4. Find the 5th power of 7.26842

$$\begin{aligned}
\log 7.26842 &= 0.86144 \\
&\quad \underline{\qquad 5} \quad \text{(multiply)} \\
\log x &= 4.30720 \quad \text{whence } x = 20286.
\end{aligned}$$

Example 5. Find the 4th root of .007564

$$\log .007564 = 7.87875 - 10.$$

(It is convenient to have, after the division by 4, -10 after the mantissa; hence before the division we add $30.00000 - 30$.)

$$\begin{aligned}
\log .007564 &= 37.87875 - 40 \quad \text{(divide by 4)}, \\
\log x &= 9.46969 - 10 \quad \text{whence } x = .2949
\end{aligned}$$

Example 6. Find the value of $\sqrt[3]{\frac{(34.55)(-856.7)(-43.5)}{(98.75)(-186.3)}}$.

We have no logarithms of negative numbers, but an inspection of this problem shows that the result will be negative and numerically the same as though all the factors were positive; hence we proceed as follows:

$$\begin{aligned}
\log 34.55 &= 1.53845 \\
\log 856.7 &= 2.93283 \\
\log 43.5 &= 1.63849 \\
\operatorname{colog} 98.75 &= 8.00546 - 10 \\
\operatorname{colog} 186.3 &= \underline{7.72979 - 10} \quad \text{(add)} \\
&\quad 1.84502 \quad \text{(divide by 3)} \\
\log(-x) &= 0.61501 \quad \text{whence } x = -4.121
\end{aligned}$$

---

* If the logarithm ends in one or more ciphers, the last significant digit is to be understood here.

9. The Slide Rule. A slide rule consists of two pieces of the shape of a ruler, one of which slides in grooves in the other; each is marked

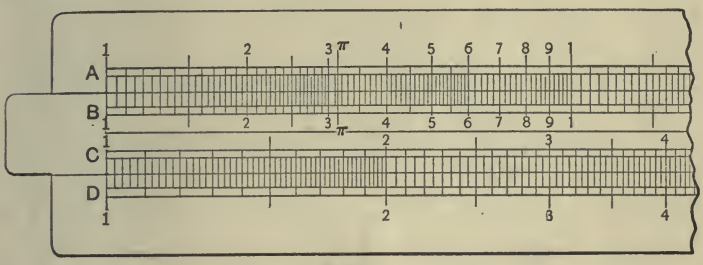

FIG. 1

(Fig. 1) in divisions (scale A and scale B) whose distances from one end are proportional to the logarithms of the numbers marked on them.

It follows that the sum of two logarithms can be obtained by simply

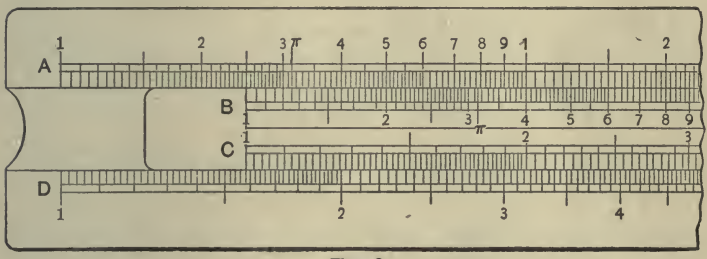

FIG. 2

sliding one rule along the other; thus if (see Fig. 2) the point marked 1 on scale B is set opposite the point marked 2.5 on scale A, the point on scale B marked 2 will be opposite the point on scale A marked 5, since $\log 2.5 + \log 2 = \log 5$. Likewise, opposite 3 (scale B) read 7.5 (scale A); opposite 2.5 (B) read 6.25 (A), *i.e.* $2.5 \times 2.5 = 6.25$.

Other multiplications can be performed in an analogous manner. Divisions can be performed by reversing the operation. Thus, if 4.5 (B) be set on 11.25 (A), then 1 (B) will be opposite 2.5 (A), as in Fig. 2.

Scales C and D are made just twice as large as scales A and B. It follows that the numbers marked on C and D are the square roots of the numbers marked opposite them on scales A and B.

For a description of more elaborate slide rules, and full directions for use, see the catalogues of instrument makers.

The student should use a slide rule in checking results; practice may be had by checking many of the results of the following list of exercises.

10. Graphical Representation of Interpolation. In the process of interpolation, values are inserted as if the logarithm varied directly as the number, between the two nearest values given in the table. Graphically, this means that the interpolation is made as if the curve $y = \log x$ consisted of a straight line segment.

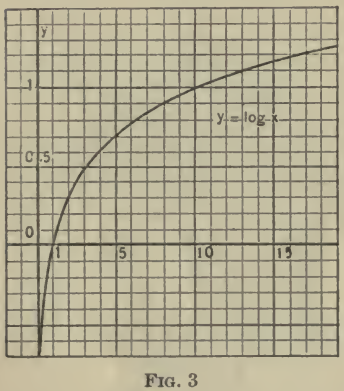

FIG. 3

If the values of x and $y = \log x$ are plotted in the usual manner, the curve obtained is that shown in Fig. 3. The values of x and y given in the table fall so close to each other on this figure that the interpolating line cannot be shown. But if the portion of the figure near $x = 2$, $y = .30103$ be enlarged in the ratio 1 to 10000 on the x-axis and 1 to 1000 on the y-axis, the resulting figure is as shown in Fig. 4. The point A shows $x = 2.001$, $y = .30125$; the point B shows $x = 2.002$, $y = .30146$; if we draw the straight line ANB, it is clear that the straight line differs from the true curve AMB, but the difference is very slight.

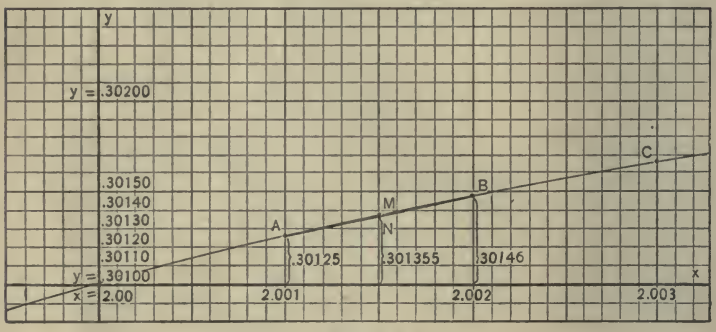

FIG. 4

Thus, the value of y given by interpolation for $x = 2.0015$ is shown at N; it is $y = .301355$. The true value of $\log 2.0015$, found from a higher place table is really .3013556; but either of these results would be written .30136 so that the error made in using the straight line ANB in place of the curve AMB does not affect the fifth place of decimals.

EXERCISES

1. Find the values of each of the following products by logarithms; check each computation by a multiplication of round numbers.

(*a*) 3.1416×205.6. (*b*) 64.32×2780.5. (*c*) $32.16 \times (-44.52)$.
(*d*) $231.6 \times .0024$. (*e*) $(-.003714) \times (1206.5)$. (*f*) $.963752 \times .0010746$.

2. Substitute $\div$ for $\times$ in each of the parts of Ex. 1, and then find the indicated quotient in each case by logarithms.

3. Find the value of each of the following expressions by logarithms; check each computation.

(*a*) $\dfrac{3.1416 \times 2109.4}{732.56 \times 23.5}$. (*b*) $\dfrac{725 \times (-3.472)}{6805.4 \times .0126}$. (*c*) $(3.1416)^2$. (*e*) $(1.728)^5$.
(*d*) $\sqrt{3.1416}$. (*f*) $(2.469)^{3/2}$.
(*g*) $(-27.345)^3$. (*h*) $(.000165)^{1/7}$. (*i*) $(3.1416)(2.34)^3 \div (.006)^{1/3}$.

4. Find the area of a circle whose radius is 47.5 ft.

5. Find the area of a rectangle whose base is 231.75 and whose height is 514.25.

6. Find the area and the volume of a sphere whose radius is 4.6152.

7. Given 1 cm. = .3937 in., reduce 4752.6 cm. to inches.

8. Reduce 675 sq. cm. to square inches.

9. Given 365.242 mean solar days = 366.242 sidereal days, express 1 mean solar day in terms of sidereal days; express 1 sidereal day in terms of mean solar days.

10. The amount a of a principal p at compound interest of rate r for n years is given by the formula: $a = p(1+r)^n$. Find a if $p = 12{,}753$, $r = .06$, and $n = 5$.

11. Evaluate each of the following expressions:

(*a*) $\sqrt{3} \cdot \sqrt[3]{5} \cdot \sqrt[5]{7}$.
(*b*) $5^{2/3} \div (12.7)^{3/2}$.
(*c*) $\dfrac{5.62 \times (4.8)^{1.5}}{(.684)^{2.3}}$.
(*d*) $\dfrac{\sqrt[3]{10000}}{(49.52)^{4.6}}$.

II. FIVE-PLACE TABLE OF THE ACTUAL VALUES OF THE TRIGONOMETRIC FUNCTIONS OF ANGLES

11. Direct Readings. This table gives the sines, cosines, tangents, and cotangents of the angles from 0° to 45°; and by a simple device, indicated by the printing, the values of these functions for angles from 45° to 90° may be read directly from the same table. For angles less than 45° read down the page, the degrees being found at the top and the minutes on the left; for angles greater than 45° read up the page, the degrees being found at the bottom and the minutes on the right.

To find a function of an angle (such as 15° 27′.6, for example) which does not reduce to an integral number of minutes, we employ the process of interpolation. To illustrate, let us find $\tan 15° 27'.6$. In the table we find $\tan 15° 27' = .27638$ and $\tan 15° 28' = .27670$; we know that $\tan 15° 27'.6$ lies between these two numbers. The process of interpolation depends on the assumption that between 15° 27′ and 15° 28′ the tangent of the angle varies directly as the angle; while this assumption is not strictly true, it gives an approximation sufficiently accurate for a five-place table. Thus we should assume that $\tan 15° 27'.5$ is halfway between .27638 and .27670. We may state the problem as follows: An increase of 1′ in the angle increases the tangent .00032; assuming that the tangent

varies as the angle, an increase of 0′.6 in the angle will increase the tangent by .6 × .00032 = .00019 (retaining only five places); hence

$$\tan 15° 27'.6 = .27638 + .00019 = .27657.$$

The difference between two successive values in the table is called, as in Table I, the *tabular difference* (.00032 above). The proportional part of the tabular difference which is used is called the *correction* (.00019 above), and is found by multiplying the tabular difference by the appropriate fraction of the smallest unit given in the table.

Example 1. Find sin 63° 52′.8.

We find $\sin 63° 52' = .89777$;
tabular difference = .00013 (subtracted mentally from the table),
correction = .8 × .00013 = .00010 (to be added).
Hence $\sin 63° 52'.8 = .89787$.

Example 2. Find tan 37° 45′.4.

$\tan 37° 45' = .77428$;
dropping useless zeros, tabular difference = 47; .4 × 47 = 19 (to be added).
Hence $\tan 37° 45'.4 = .77447$.

Example 3. Find cos 65° 24′.8.

$\cos 65° 24' = .41628$;
tabular difference = 26; .8 × 26 = 21
(to be subtracted because the cosine decreases as the angle increases).
Hence $\cos 65° 24'.8 = .41607$.

Example 4. Find ctn 32° 18′.5.

ctn 32° 18′ = 1.5818;
tabular difference = 10; .5 × 10 = 5 (to be subtracted).
Hence ctn 32° 18′.5 = 1.5813.

RULE. *To find a trigonometric function of an angle by interpolation: select the angle in the table which is next smaller than the given angle, and read its sine (cosine or tangent or cotangent as the case may be) and the tabular difference. Compute the correction as the proper proportional part of the tabular difference. In case of sines or tangents* add *the correction; in case of cosines or cotangents,* subtract *it.*

12. Reverse Readings. Interpolation is also used in finding the angle when one of its functions is given.

Example 1. Given $\sin x = .32845$, to find x.

Looking in the table we find the sine which is next less than the given sine to be .32832, and this belongs to 19° 10′. Subtract the value of the sine selected from the given sine to obtain the actual difference = .00013; note that the tabular difference = .00027. The actual difference divided by the tabular difference gives the correction = 13/27 = .5 as the decimal of a minute (to be added). Hence $x = 19° 10'.5$.

Example 2. Given $\cos x = .28432$, to find x.

The cosine in the table next less than this is .28429 and belongs to 73° 29′; the tabular difference is 28; the actual difference is 3; correction = 3/28 = .1 (to be subtracted). Hence $x = 73° 29'.9$.

Example 3. Given $\tan x = 2.8573$, to find x.

The tangent in the table next less than this is 2.8556 and belongs to 70° 42′; the tabular difference is 26; the actual difference is 17; correction 17/26 = .7 (to be added). Hence
$x = 70° 42'.7$.

RULE. *To find an angle when one of its trigonometric functions is given: select from the table the same named function which is next less than the given function, noting the corresponding angle and the tabular difference; compute the actual difference (between the selected value of the function and the given value) and divide it by the tabular difference; this gives the correction which is to be added if the given function is sine or tangent, and to be subtracted if the given function is cosine or cotangent.*

III. FIVE-PLACE COMMON LOGARITHMS OF THE TRIGONOMETRIC FUNCTIONS

13. Use of the Table. If it is required to find the numerical value of $x = 27.85 \times \sin 51° 27'$, we may apply logarithms as follows:

$$\log 27.85 = 1.44483.$$
$$\log \sin 51° 27' = 9.89324 - 10 \text{ (add).}$$
$$\log x = \overline{1.33807} \qquad x = 21.78$$

The only new idea here is the method of finding $\log \sin 51° 27'$, which means the logarithm of the sine of $51° 27'$. The most obvious way is to find in Table I, $\sin 51° 27' = .78206$, and then to find in Table II, $\log .78206 = 9.89324 - 10$, but this involves consulting two tables. To avoid the necessity of doing this, Table III gives the logarithms of the sines, cosines, tangents, and cotangents. The arrangement and the principles of interpolation are similar to those given on p. viii for Table I. The student should note carefully that Table III does not give the sines, cosines, etc., of angles, but rather their logarithms; also that the sines and cosines of all acute angles, the tangents of all acute angles less than 45° and the cotangents of all acute angles greater than 45° are proper fractions, and their logarithms end with -10, which is not printed in the table, but which should be written down whenever such a logarithm is used.

Example 1. Find $\log \sin 68° 25'.4$.

On the page having 68° at the bottom, and in the row having 25′ on the right find $\log \sin 68° 25' = 9.96843 - 10$; the tabular difference is 5; $.4 \times 5$ is given in the margin as 2; this is the correction to be added, giving $\log \sin 68° 25'.4 = 9.96845 - 10$.

(In case of sine and tangent *add* the correction.)

Example 2. Find $\log \cos 43° 39'.4$.

$\log \cos 43° 39' = 9.81998 - 10$, tabular difference 15.

$.4 \times 15 = 6$ (subtract) therefore $\log \cos 43° 39'.4 = 9.81992 - 10$.

(In case of cosine and cotangent, subtract the correction.)

Example 3. Given $\log \tan \alpha = 0.77663$, to find α.

The logarithmic tangent in Table III next less than the given one is 0.77639 and belongs to 80° 30′; the actual difference is 24; the tabular difference is 78; hence the correction is $24/78 = .3$ (add); hence $\alpha = 80° 30'.3$.

Example 4. Given $\log \cos \alpha = 9.72581 - 10$, to find α.

The logarithmic cosine next less than the given one is $9.72562 - 10$ and belongs to 57° 53′; the actual difference is 19; the tabular difference is 20; hence the correction is $19/20 = 1.0$ (to the nearest tenth); (subtract); hence $\alpha = 57° 52'.0$.

In finding $\log \operatorname{ctn} \alpha$ for any angle α, note that $\log \operatorname{ctn} \alpha = -\log \tan \alpha$, since $\operatorname{ctn} \alpha = 1/\tan \alpha$. Hence *the tabular differences for* log ctn *are precisely the same as those for* log tan *throughout the table, but taken in reversed order.* Likewise, $\log \sec \alpha = -\log \cos \alpha$, $\log \csc \alpha = -\log \sin \alpha$; hence $\log \sec \alpha$ and $\log \csc \alpha$ are omitted.

For angles near 0° or near 90°, the interpolations are not very accurate if the differences are large. A special process, called *logarithmic interpolation*, is given on p. 45, for angles below 3° or above 87°.

IV–V. RADIAN MEASURE

14. Computations in Radian Measure. The reduction of degrees to radians is facilitated by Table IV — *Conversion of Degrees to Radians.*

The values of $\sin x$, $\cos x$, $\tan x$, are stated for every angle x from 0.00 radians to 1.60 radians at intervals of .01 radian in Table V — *Trigonometric Functions in Radian Measure.*

The reduction of radians to degrees can be performed directly by Table V; or, for greater accuracy, by the supplementary Table V*a*.

VI. POWERS — ROOTS — RECIPROCALS

15. Arrangement. This table is arranged so that the square, cube, square root, cube root, or reciprocal can be read directly to five decimal places for any number n of three significant figures. To attain this, not only n^2, n^3, $\sqrt{n}$, $\sqrt[3]{n}$, $1/n$, but also $\sqrt{10\,n}$, $\sqrt[3]{10\,n}$, $\sqrt[3]{100\,n}$ are printed on every page. All values have been carefully recomputed and checked.

Thus to find $\sqrt{1.17}$, read in $\sqrt{n}$ column the result: 1.08167. To find $\sqrt{11.7}$, read *in the same line*, in $\sqrt{10\,n}$ column the result: 3.42053. To find $\sqrt{117}$, read 10 times the entry in $\sqrt{n}$ column, since $\sqrt{117} = 10\sqrt{1.17}$.

Similarly, $\sqrt[3]{1.17} = 1.05373$ from $\sqrt[3]{n}$ column; $\sqrt[3]{11.7} = 2.27019$ from *the same line* in $\sqrt[3]{10\,n}$ column; $\sqrt[3]{117} = 4.89097$ from *the same line* in $\sqrt[3]{100\,n}$ column.

The effect of a change in the decimal point in n^2, n^3, and $1/n$ is only to shift the decimal point in the result, without altering the digits printed.

16. Uses. One principal use of this table in Trigonometry is to make the *Pythagorean Theorem* and the *Law of Cosines* practicable as formulas for actual computation, in an obvious manner.

For mensuration formulas, etc., all the entries are very convenient.

VII. NAPIERIAN OR NATURAL LOGARITHMS

17. The Base *e*. — Natural Logarithms. The number $e = 2.7182818\cdots$ is called the **natural base** of logarithms. The logarithms of numbers to this base are given in Table VII at intervals of .01 from 0.01 to 10.09, and at unit intervals from 10 to 409. The fundamental relation $\log_e n = \log_e 10 \times \log_{10} n$ enables us to transfer from the base 10 to the base e, or conversely; where $\log_e 10 = 2.30258509$.

A — B — C. FOUR-PLACE TABLES

18. Four-place Tables. These are duplicates of the preceding five-place tables, reduced to four places, and with larger intervals between the tabulations. The value of such four-place tables consists in the greater speed with which they can be used, in case the degree of accuracy they afford is sufficient for the purpose in hand.

A. **Logarithms of Numbers.** The only special feature of this table is that *the proportional parts are printed for every tenth in every row;* hence the logarithm of any number of *four* significant figures can be read directly, by a mental addition of the proportional part corresponding to the last figure. There may be an error of 1 in the last place in the result.

B. **Antilogarithms.** Attention is called to the table of antilogarithms, in which the *numbers* corresponding to *given logarithms* are tabulated. This table, together with the accompanying four-place logarithm table, will be found to facilitate approximate calculations to a marked degree, especially when great accuracy is not necessary. Thus these tables are convenient in *checking* results found otherwise. The proportional parts are stated in the right-hand margin for each row separately; hence the antilogarithm of a number of four significant figures can be read almost immediately, the addition of the proper correction being performed mentally. This arrangement, with the corresponding one in Table A, makes the tables *effectively* four-place each way.

C. **Values and Logarithms of Trigonometric Functions.** In this table, the values of $\sin \alpha$, $\cos \alpha$, $\tan \alpha$, $\operatorname{ctn} \alpha$, and their common logarithms, are stated for each 10 minute interval in α. The characteristics of the logarithms are omitted, since they can be supplied readily from the value, as in the case of Table A.

---

19. Sources and Checks used. In arranging all of these tables, several extant tables have been used as sources; and the proofs have been read against the standard seven-place tables of Vega, and at least one other table, or against at least two independent sources when the figures are not given by Vega. In all cases, the stereotyped plates have been proof-read five times, by three different persons.

In case of apparent doubt, especially in the last place of decimals, the values have been recomputed, either by series or by the condensed fifteen-place tables of Hoüel.

While errors may occur, it is believed that they must be purely typographical; in most cases such an error is revealed by the unreasonable differences it creates.

TABLE III

COMMON LOGARITHMS

OF THE

TRIGONOMETRIC FUNCTIONS

FROM

0° TO 90° AT INTERVALS OF ONE MINUTE

TO

FIVE DECIMAL PLACES

NOTE: *To find* $\log \sin \alpha$ *and* $\log \tan \alpha$ *more precisely than by ordinary interpolation, for small values of* α, *if* α *is not a tabulated angle.*

Let t be the first tabulated angle below α. Express both α and t in the same unit (minutes, or seconds, or any other convenient unit). Then

$$\log \sin \alpha - \log \sin t = \log \alpha - \log t,$$

approximately, at least to five decimal places if $\alpha < 3°$ and $\alpha - t < 1'$.

Now $\log \alpha$ and $\log t$ can be found from Table I, and $\log \sin t$ is tabulated in Table III; hence $\log \sin \alpha$ can be found. Thus to find $\log \sin 1° 12'.4$, write $1° 12'.4 = 72'.4$, and arrange the computation as follows:

$\log 72.4 =$	1.85974	(Table I)
$\log 72.0 =$	1.85733	(Table I)
(subtract)	0.00241	
$\log \sin 1° 12' = \log \sin 72' =$	8.32103 − 10	(Table III)
$\log \sin 1° 12'.4 = \log \sin 72'.4 =$	8.32344 − 10	(Required)

Likewise $\log \tan \alpha - \log \tan t = \log \alpha - \log t$, approximately, at least to five decimal places if $\alpha < 3°$ and $\alpha - t < 1'$. The method of calculation is exactly as above.

The cosines and cotangents of angles near 90° can be found by first reducing them to sines and tangents of angles near 0°. Above 3° ordinary interpolation is quite reliable, but the fifth place may be wrong in any interpolation process.

	L Cos	d	L Ctn	c d	L Tan	L Sin	′

For logarithms of sines or tangents of angles less than 3° (or logarithms of cosines or cotangents of angles greater than 87°), see Note on interpolation, p. 45.

When the tabular differences are large, that method is usually better. The proportional parts stated for 1° and 2° in this table are sufficient when great accuracy is not required, even if the ordinary method of interpolation is used.

Above 409, use the formula $\log_e 10\,n = \log_e n + \log_e 10 = \log_e n + 2.30258509$,

or the formula $\log_e n = \log_e 10 \cdot \log_{10} n = 2.30258509\ \log_{10} n$.

N	0	1	2	3	4	5	6	7	8	9	1 2 2	4 5 6	7 8 9

The proportional parts are stated in full for every tenth at the right-hand side. The logarithm of any number of four significant figures can be read directly by add-
